## **RESEARCH ACTIVITY:**

- **Structural role of transition elements and trace elements in minerals, silicate glasses and melts.**  
Study of the local structural environment and oxidation state of transition elements in minerals and their synthetic analogues by combining element-specific spectroscopic techniques (such as XAS) and long range structural techniques (X-ray diffraction).  
Also the structural environment of Transition elements and REE in silicate glasses are studied in connection with the glass physical properties (viscosity, density, optical properties) and redox/temperature conditions.
- **Synthesis of silicate crystals and glasses at high temperature and/or pressure**  
Synthesis of crystalline silicates, oxides, phosphates, and silicate glasses aimed at structural studies or aimed at studying materials with technological applications (Li-ion batteries, lasing glasses, ceramic material).
- **X-ray Absorption Spectroscopy (XANES, EXAFS).**  
Methodological studies on the use of XAS for studying redox and structural environment of diluted elements in crystals and glasses by means of pre-edge peaks, theoretical XANES calculations, combination of XANES, EXAFS, and XRD.  
Application of XAS to mineralogical and geochemical problems
- **Powder- and single crystal- X-ray Diffraction.**  
Structural studies of minerals and their synthetic analogues
- **Structural and geochemical study of impact glasses.**  
Study of the Fe redox and water content in glasses formed during hypervelocity impacts aimed at deciphering formation conditions and redox/temperature conditions during melt formation and transport of distal ejecta.
